

AUTOMATED

AS-BUILTS - WORK AS EXECUTED

AS CONSTRUCTED

AS CONSTRUCTED DESIGN CERTIFICATION (ACDC)

When an industry needs a standard to improve the efficiency of a business process you can guarantee that there will be more than one standard available. Our approach to solving the automation of importing data into corporate Geospatial and Asset Management databases is to provide an application that supports multiple standards.

Are you responsible for capturing, validating and importing data “gifted” from either private developers or from your internal capital works team? Are you being asked to do more with the same or fewer staff?

Our Automated ‘As-Constructed’ (ACDC) product addresses the need for private developers / surveyors to deliver high integrity, high quality line work and attribution to utilities and local authorities according to a standardised approach.

In ACDC, Open Spatial Australia delivers a product that eliminates incomplete or inconsistent data; releases GIS staff, dedicated to data processing, to complete more important tasks; avoids the risks associated with the re-capture of data delivered electronically; and reduces data capture backlogs.

ACDC provides an utility / council with an automated process that standardises the capture and dissemination of information into two mission critical databases – Asset Management and GIS.

FOR YOUR GIS

ACDC eliminates errors and redundant data; imports clean spatial data directly into your GIS, including GIS specific attribution; and generates huge productivity improvements.

FOR ASSET MANAGEMENT SYSTEM

ACDC automatically creates the skeleton assets directly in your Asset Management System; stages the creation, and applies through Asset Management system; captures at source the asset data off ‘as-cons / as-builts’; and associates asset and spatial entities on creation.
